

## CLAIMS

1. Cable box characterized in that metallic radiating plates are transversely arranged inside a foursquare metallic pipe to divide the inner space of the metallic pipe and house foursquare synthetic resin-made tubes piled one on another within thus divided compartments, in order to place the radiating plates at the bottom of the synthetic resin-made tubes to house power cables.
2. Cable box characterized in that metallic radiating plates are transversely arranged inside a foursquare metallic pipe while partition plates are longitudinally arranged, monolithically forming the radiating plates, the metallic pipe and partition plates at touching ends to divide the inner space of the metallic pipe into compartments and house foursquare synthetic resin-made tubes piled one on another within thus divided compartments, thereby placing the radiating plates at the bottom of the synthetic resin-made tubes to house power cables.
